

Step-by-Step Guide: Create React App and Push to GitHub

1. Create a New React App

1. Install Node.js (LTS) from <https://nodejs.org/>
2. Open your terminal and run the following commands:

```
npx create-react-app my-app  
cd my-app  
code .
```

2. Set Up Git (First Time Only)

If you haven't configured Git globally yet, run these commands:

```
git config --global user.name "Your Name"  
git config --global user.email "you@example.com"
```

3. Initialize Git in Your Project

1. Initialize the Git repository:

```
git init
```

2. Ensure `.gitignore` includes `node_modules/` (it's already added by Create React App).

3. Stage and commit your initial code:

```
git add .  
git commit -m "Initial commit: Create React App"
```

4. Create a Repository on GitHub

1. Go to GitHub and click **New Repository**.
2. Name your repository (e.g., `my-app`) and keep it **empty** (no README, `.gitignore`, or license).

5. Connect Local Project to GitHub

Replace USER and REPO with your GitHub username and repository name:

```
git branch -M main
```

```
git remote add origin https://github.com/USER/REPO.git  
git push -u origin main
```

6. Future Updates (Making Changes)

Whenever you make changes to your code, use:

```
git add -A  
git commit -m "Describe your change"  
git push
```
